

Plainpaper

Academic papers simplified

Problem

Academic papers are written for experts, not students

Students in under-resourced universities struggle most

Plain-language-first → 1.5-2.5x better conceptual understanding (McDonnell et al., 2016)

Solution

Plainpaper simplifies IT/CS papers section-by-section into plain English

Preserves structure, skips math and algorithms entirely

Side-by-side view: original always visible for verification

Builds a persistent glossary bank across papers

Domain guard: rejects non-IT input with a soft warning

Live Demo

Plainpaper

Ethical Reflection

What is the biggest risk?

The AI quietly changes meaning, dropping a caveat or making "may correlate with" sound like "causes"

How likely is this?

LLMs produce factual errors in 3-27% of summarized claims (Maynez et al., 2020)

Who gets hurt most?

Students who can't verify accuracy themselves, exactly the target group

What did I do about it?

Side-by-side view, math untouched by the prompt, domain guard blocks non-IT input

What would happen if the LLM stops working?

The app returns an error and stops. No fallback, fully API-dependent. Known limitation.
